The sequence was deduced from an open reading frame (ORF) of the IAV.MAL genome (see AAV63467). 7 ORFS (see AAW72992-98) were identified. Specific peptides of the envelope glycoprotein can be used as antigens in a claimed method for the in vitro detection of an antibody directed against LAV. The method is useful for the diagnosis of AIDS or pre-AIDS, or to detect antibodies in patients, asymptomatic carriers and in blood-related products. IAV viral

```
The invention relates to a nucleic acid vector comprising at least one HIV sequence operably linked to a promoter and encoding a protein that does not assemble into viral particles. The nucleic acid vector is useful in immunizing a subject against HIV infection. This sequence corresponds to a nucleic acid used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               387
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    447

LAV EL I (AAN80436) and LAV MA L (AAN80437) were isolated LICUM LUE peripheral blood lymphocytes of patients. Different AIDS virus isolates concerned are designated by 3 letters of the patients name. Stable probes including the DNA sequences can be used for detection of the new LAV viruses or related viruses on DNA proviruses in eq. biological samples. The proteins or peptides can be used for detection of antibodies induced in vivo and present in biological fluids. The DNA can also be used for the expression of LAV viral antigens for the prodn. of a vaccine against LAV. The polypeptides can also be used for the prodn. of antibodies for the detection of proteins related to the LAV viruses, partic. for diagnosis of AIDS or pre-AIDS. (Updated on 25-MAR-2003 to correct PI field.) (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                   New variants of lymphadenopathy associated virus (LAV) - used for prodn. of DNA, antigens and antibodies used in diagnosis of AIDS and pre-AIDS.

The specification describes a method of determining the influence of variation in host genes on selection of microorganisms with protein substitutions. The method comprises typing all individuals of a population of patients infected with a microorganism for at least one selected intrinsic polymorphic marker involved in the host response to the presence of the microorganism. The method is useful for examining selective pressures confronting a wide range of organisms that exhibit pathogenic traits in a host, such as bacteria, fungl, mycobacterium, viruses and virus-like particles; for examining microorganisms that have adapted to evolve rapidly, including HIV and AIDS related viruses and the hepatitis related viruses such as HV and HBV. The method is useful for designing a vaccine to prevent or delay the emergence of drug resistance in patients treated with a particular drug specific for a microorganism check muchecide or amino acid level. The presents at the nucleotide or amino acid level. The present sequence represents a HIV pol protein, which is expected to provide optimal cytotoxic I lymphocyte. CTL) induced therapeutic protection to the cohort examined in that study

Sequence 1003 AA;

H17-1 retropepsin (EC 3.4.23.16) - human immunodeficiency virus type 1 (strain YU-2)

H17-1 retropepsin (EC 3.4.23.16) - human immunodeficiency virus type 1)

N;Contains: endonuclease (EC 3.1....); retropepsin (EC 3.4.23.16); RNA-directed DNA poly.

C;Species: human immunodeficiency virus type 1, H1V-1

A;Note: host Homo sapiens (man)

C;Accession: B44001
